Application/Control Number: 10/749,882 Page 2

Art Unit: 1709

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-4 and 8-14 rejected under 35 U.S.C. 103(a) as being anticipated by Brandhorst (3,989,541) in view of Kariya (6,140,570).

In regards to claims 1-4,8, and 9, Brandhorst discloses a photovoltaic/solar cell assembly in Figure 1, for use in an outer space environment or a non-Earth environment, comprising (col.1; lines: 11-15):

- (a) a photovoltaic conversion layer (10) configured to produce an electrical current when receiving photons (col. 3; lines: 60-63), said photovoltaic conversion layer (10) having a top surface (14) and a bottom surface (13);
- (b) a first electrical contact layer/electrode electrically coupled to said top surface and a second electrical contact layer electrically coupled to said bottom surface (col.4; lines: 25-30);
- (c) first electrical contact layer (14) configured to receive electrons from an outer space environment (col. 1; lines: 11-15) and to conduct said electrons away from said photovoltaic conversion layer

Art Unit: 1709

(d) a second layer of titanium dioxide (col.4; lines: 25-30)

Brandhorst fails to disclose the thickness and the emissivity of a transparent electrically conductive layer constructed from indium tin oxide (ITO) and zinc oxide (ZnO). Kariya discloses a photovoltaic device (Figure 1) and further discloses a transparent electrically conductive layer (103) is constructed from indium tin oxide (col. 21; lines: 58-62) and zinc oxide (col. 5; lines: 8-17) with a thickness of 50-300 nanometers with an emissivity/intermediate layer (col. 6; lines: 45-48) disposed between the transparent electrically conductive layer (103) and the first electrode/metallic back reflecting layer (102). Kaisha teaches that a transparent and electrically conductive layer is interposed between a back reflecting layer and a metallic material as the back reflective layer, and the transparent and electrically conductive layer is designed to have a surface provided with a irregular structure (or a textured structure), thereby providing improved light absorption efficiency (col.2; lines: 50-55). It would have been obvious to one of ordinary skill in the art at the time of the invention to use a transparent electrically conductive layer of Kaisha in the photovoltaic device of Brandhorst in order to provide for improved light absorption efficiency.

In regard to claims 10-14, Brandhorst discloses a method for reducing electrostatic discharges/internal resistance losses (col.1; lines: 29-41) in a solar cell assembly used in an outer space environment or a non-Earth environment (col.1; lines: 10-15), the method comprising:

(a) receiving electrons from an outer space environment to a layer (14) covering at least a portion of a solar cell (col.2; lines: 52-61);

Art Unit: 1709

(b) conducting said electrons through said the layer (14) away from said solar cell so that said electrons do not pass through said solar cell (col.1; lines: 58-60).

(c) a second layer of titanium dioxide (col.4; lines: 25-30)

Brandhorst fails to disclose the thickness and the emissivity of a transparent electrically conductive layer constructed from indium tin oxide (ITO) and zinc oxide (ZnO). Kariya discloses a photovoltaic device (Figure 1) and further discloses a transparent electrically conductive layer (103) constructed from indium tin oxide (col. 21; lines: 58-62) and zinc oxide (col. 5; lines: 8-17) with a thickness range from 50-300 nanometers with an emissivity/intermediate layer (col. 6; lines: 45-48) disposed between the transparent electrically conductive layer (103) and the first electrode/metallic back reflecting layer (102). Kaisha also teaches that a transparent electrically conductive layer is attached to a metallic material back reflecting layer, and the transparent electrically conductive layer is designed to have a surface provided with a irregular structure (or a textured structure), thereby providing improved light absorption efficiency (col.2; lines: 50-55). It would have been obvious to one of ordinary skill in the art at the time of the invention to use a transparent electrically conductive layer of Kaisha in the photovoltaic device of Brandhorst in order to provide for improved light absorption efficiency.

3. Claims 5,7, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brandhorst (3,989,541) and Kariya (6,140,570), in view of Chang et al. (5,405, 680).

Page 5

In regard claim 5,7, and 16, modified Brandhorst discloses the photovoltaic device where portions reflect solar radiation (col.2; lines:13-16) as discussed with

regards to claims 1 and 10 respectively, but fails to disclose an emissivity of the

transparent electrically conductive layer configured to have an emissivity greater than or

equal to 0.8 (col. 11;lines: 26-31).

Chang et al. discloses materials, which reflect solar radiation (col. 3; lines: 3-8), and further discloses an emissivity material with a high emissivity level equal to one to reflect portions of the light in the 8-13 µm wavelength region (col.11; lines 24-25). Chang et al. teaches that the material is matched to the emissivity level that is responsive to that wavelength region (col. 11; lines: 26-31). It would have been obvious to one of ordinary skill in the art at the time of the invention to set the emissivity level of the anti-reflective coating greater than 0.8 taught in Change et al. to the transparent electrically conductive layer (103) of Kariya, in order to match the wavelength region of the incident radiation.

4. Claims 6 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brandhorst (3,989,541) and Kariya (6,140,570), in view of Thomas et al. (4,488,047).

Brandhorst discloses the photovoltaic device in Figure 1 as in claim 1 and 10 respectively, but fails to disclose the transparent electrically conductive layer to absorb wavelengths less than 5 microns in length.

Thomas discloses a photovoltaic device/solar concentrator (Figure 1) and further

Art Unit: 1709

discloses a layer configured to absorb at least 0.4-1.8 μ m wavelengths of light (col. 3; lines: 21-26) by way of having each layer of the multilayered device absorb at different wavelength in order to enhance the solar radiation collection (col 4; lines: 24-31). It would have been obvious to one of ordinary skill in the art at the time of the invention to receive solar radiation at wavelengths of 0.4-1.8 μ m of Thomas to the solar concentrator of Brandhorst in order to enhance the solar radiation collection.

Conclusion

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Asha Hall whose telephone number is 571-272-9812. The examiner can normally be reached on Monday-Thursday 8:00-6:30PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alexa Neckel can be reached on 571-272-1446. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
